

IS5 in R: Comparing Counts (Chapter 19)

Nicholas Horton (nhorton@amherst.edu)

2025-01-20

Table of contents

Introduction and background	1
Chapter 19: Comparing Counts	2
Section 19.1: Goodness-of-Fit Tests	2
Section 19.2: Chi-Square Test of Homogeneity	7
Section 19.3: Examining the Residuals	10
Section 19.4: Chi-Square Test of Independence	10

Introduction and background

This document is intended to help describe how to undertake analyses introduced as examples in the Fifth Edition of *Intro Stats* (2018) by De Veaux, Velleman, and Bock. This file as well as the associated Quarto reproducible analysis source file used to create it can be found at <http://nhorton.people.amherst.edu/is5>.

This work leverages initiatives undertaken by Project MOSAIC (<http://www.mosaic-web.org>), an NSF-funded effort to improve the teaching of statistics, calculus, science and computing in the undergraduate curriculum. In particular, we utilize the `mosaic` package, which was written to simplify the use of R for introductory statistics courses. A short summary of the R needed to teach introductory statistics can be found in the `mosaic` package vignettes (<https://cran.r-project.org/web/packages/mosaic>). A paper describing the `mosaic` approach was published in the *R Journal*: <https://journal.r-project.org/archive/2017/RJ-2017-024>.

We begin by loading packages that will be required for our analyses.

```
library(mosaic)
library(tidyverse)
```

Chapter 19: Comparing Counts

```
Zodiac <- read_csv("http://nhorton.people.amherst.edu/is5/data/Zodiac.csv")
```

```
Rows: 12 Columns: 4
```

```
-- Column specification -----
```

```
Delimiter: ","
```

```
chr (1): Month
```

```
dbl (3): Births, Expected, Residual
```

```
i Use `spec()` to retrieve the full column specification for this data.
```

```
i Specify the column types or set `show_col_types = FALSE` to quiet this message.
```

By default, `read_csv()` prints the variable names. These messages can be suppressed using the message: `false` code chunk option to save space and improve readability.

```
Zodiac |>
  select(Month, Births)
```

```
# A tibble: 12 x 2
```

	Month	Births
	<chr>	<dbl>
1	Pisces	29
2	Aquarius	24
3	Aries	23
4	Cancer	23
5	Capricorn	22
6	Scorpio	21
7	Taurus	20
8	Leo	20
9	Saggitarius	19
10	Virgo	19
11	Libra	18
12	Gemini	18

Section 19.1: Goodness-of-Fit Tests

Example 19.1: Finding Expected Counts

```
# page 611
BaseballBirths <- read_csv("http://nhorton.people.amherst.edu/is5/data/Ballplayer_births.csv")
janitor::clean_names() # doesn't contain national birth %
```

Here we use the `clean_names()` function from the `janitor` package to sanitize the names of the columns (which would otherwise contain special characters or whitespace).

```
natbirth <- c(.08, .07, .08, .08, .08, .08, .09, .09, .09, .09, .08, .09)
BaseballBirths <- cbind(BaseballBirths, natbirth) # adding a column for national birth %
totaln <- sum(~ballplayer_count, data = BaseballBirths)
totaln
```

```
[1] 1478
```

```
BaseballBirths <- BaseballBirths |>
  mutate(
    expected = totaln * natbirth,
    observed = ballplayer_count,
    contrib = (observed - expected)^2 / expected
  )
sum(~contrib, data = BaseballBirths)
```

```
[1] 26.48442
```

Assumptions and Conditions

Calculations

Chi-Square P-values

```
# Examples of chisq p-values
qchisq(df = 2, p = .1, lower.tail = FALSE)
```

```
[1] 4.60517
```

```
qchisq(df = 10, p = .05, lower.tail = FALSE)
```

```
[1] 18.30704
```

Example 19.3: Doing a Goodness-of-Fit Test

```
# page 614
df <- nrow(BaseballBirths) - 1
df
```

```
[1] 11
```

```
chisq <- sum(~contrib, data = BaseballBirths)
xpchisq(q = chisq, df = df, lower.tail = FALSE)
```

```
[1] 0.005494028
```

Step-By-Step Example: A Chi-Square Test for Goodness-of-Fit

```
expected <- mean(~ Births, data = Zodiac)
expected
```

```
[1] 21.33333
```

```
gf_col(Births ~ Month, data = Zodiac) |>
  gf_hline(yintercept = expected) |>
  gf_labs(x = "Sign", y = "Count") +
  theme(axis.text.x = element_text(angle = 30, hjust = 1)) # to adjust the angle of the x axis
```

```
# Mechanics
df <- nrow(Zodiac) - 1
df
```

```
[1] 11
```

```
Zodiac <- Zodiac |>
  mutate(chisq = ((Births - Expected)^2) / Expected)
chisq <- sum(~chisq, data = Zodiac)
chisq
```

```
[1] 5.09383
```

```
xpchisq(q = chisq, df = df, lower.tail = FALSE)
```

```
[1] 0.9265374
```

The Chi-Square Calculation

```
Zodiac |>
  mutate(residsq = Residual^2) |>
  mutate(component = residsq / Expected)
```

```
# A tibble: 12 x 7
```

	Month	Births	Expected	Residual	chisq	residsq	component
	<chr>	<dbl>	<dbl>	<dbl>	<dbl>	<dbl>	<dbl>
1	Pisces	29	21.3	7.67	2.76	58.8	2.76
2	Aquarius	24	21.3	2.67	0.333	7.11	0.333
3	Aries	23	21.3	1.67	0.130	2.78	0.130
4	Cancer	23	21.3	1.67	0.130	2.78	0.130
5	Capricorn	22	21.3	0.667	0.0209	0.445	0.0209
6	Scorpio	21	21.3	-0.333	0.00520	0.111	0.00520
7	Taurus	20	21.3	-1.33	0.0833	1.78	0.0833
8	Leo	20	21.3	-1.33	0.0833	1.78	0.0833
9	Saggitarius	19	21.3	-2.33	0.255	5.44	0.255
10	Virgo	19	21.3	-2.33	0.255	5.44	0.255
11	Libra	18	21.3	-3.33	0.521	11.1	0.521
12	Gemini	18	21.3	-3.33	0.521	11.1	0.521

The Trouble with Goodness-of-Fit Tests: What's the Alternative?

Section 19.2: Chi-Square Test of Homogeneity

```
# Create the data set
Postgrad <- bind_rows(
  do(209) * data.frame(activity = "Employed", school = "Agriculture"),
  do(198) * data.frame(activity = "Employed", school = "Arts & Sciences"),
  do(177) * data.frame(activity = "Employed", school = "Engineering"),
  do(101) * data.frame(activity = "Employed", school = "ILR"),
  do(104) * data.frame(activity = "Grad School", school = "Agriculture"),
  do(171) * data.frame(activity = "Grad School", school = "Arts & Sciences"),
  do(158) * data.frame(activity = "Grad School", school = "Engineering"),
  do(33) * data.frame(activity = "Grad School", school = "ILR"),
  do(135) * data.frame(activity = "Other", school = "Agriculture"),
  do(115) * data.frame(activity = "Other", school = "Arts & Sciences"),
  do(39) * data.frame(activity = "Other", school = "Engineering"),
  do(16) * data.frame(activity = "Other", school = "ILR")
)
```

```
# Table 19.1, page 618
tally(activity ~ school, data = Postgrad, margins = TRUE)
```

	school			
activity	Agriculture	Arts & Sciences	Engineering	ILR
Employed	209	198	177	101
Grad School	104	171	158	33
Other	135	115	39	16
Total	448	484	374	150

```
# Table 19.2
tally(activity ~ school, format = "percent", data = Postgrad, margins = TRUE)
```

	school			
activity	Agriculture	Arts & Sciences	Engineering	ILR
Employed	46.65179	40.90909	47.32620	67.33333
Grad School	23.21429	35.33058	42.24599	22.00000
Other	30.13393	23.76033	10.42781	10.66667
Total	100.00000	100.00000	100.00000	100.00000

```
# Table 19.3
with(chisq.test(tally(activity ~ school, data = Postgrad, margins = TRUE)), expected)
```

	school			
activity	Agriculture	Arts & Sciences	Engineering	ILR
Employed	210.76923	227.7060	175.95467	70.57005
Grad School	143.38462	154.9066	119.70055	48.00824
Other	93.84615	101.3874	78.34478	31.42170
Total	448.00000	484.0000	374.00000	150.00000

Step-By-Step Example: A Chi-Square Test for Homogeneity

We can undertake a chi-square test for homogeneity. First let's display the data.

```
tally(activity ~ school, format = "percent", data = Postgrad) |>
  data.frame() |>
  gf_col(Freq ~ school, fill = ~activity, position = "dodge") |>
  gf_labs(x = "School", y = "Percent", fill = "")
```

```
# Mechanics
tally(activity ~ school, data = Postgrad, margins = TRUE)
```

school

activity	Agriculture	Arts & Sciences	Engineering	ILR
Employed	209	198	177	101
Grad School	104	171	158	33
Other	135	115	39	16
Total	448	484	374	150

```
with(chisq.test(tally(activity ~ school, data = Postgrad, margins = TRUE)), expected)
```

	school			
activity	Agriculture	Arts & Sciences	Engineering	ILR
Employed	210.76923	227.7060	175.95467	70.57005
Grad School	143.38462	154.9066	119.70055	48.00824
Other	93.84615	101.3874	78.34478	31.42170
Total	448.00000	484.0000	374.00000	150.00000

```
with(chisq.test(tally(activity ~ school, data = Postgrad)), statistic)
```

X-squared
93.65667

```
xpchisq(q = 93.7, df = 6, lower.tail = FALSE)
```

```
[1] 5.154981e-18
```

Section 19.3: Examining the Residuals

Table 19.4, page 622

```
with(chisq.test(tally(activity ~ school, data = Postgrad, margins = TRUE)), residuals)
```

	school			
activity	Agriculture	Arts & Sciences	Engineering	ILR
Employed	-0.12186553	-1.96860027	0.07880484	3.62235442
Grad School	-3.28908677	1.29304319	3.50061599	-2.16606715
Other	4.24817296	1.35191804	-4.44510568	-2.75117035
Total	0.00000000	0.00000000	0.00000000	0.00000000

Example 19.4: Looking at χ^2 , Residuals

BaseballBirths |>

```
mutate(residuals = (ballplayer_count - expected) / (expected^.5)) |>  
select(month, residuals)
```

	month	residuals
1	1	1.72524439
2	2	1.72442119
3	3	-0.20599933
4	4	0.25382060
5	5	0.71364054
6	6	-0.38992730
7	7	-2.68957291
8	8	2.77280921
9	9	0.08497039
10	10	-1.56241469
11	11	-1.21760318
12	12	-0.95548335

Section 19.4: Chi-Square Test of Independence

```
Tattoos <- read_csv("http://nhorton.people.amherst.edu/is5/data/Tattoos.csv", skip = 1) |>  
janitor::clean_names() # skip = 1 because first row is "Col1", "Col2"  
# Table 19.5, page 623  
tally(location ~ has_hepatitis_c, data = Tattoos, margins = TRUE)
```

location	has_hepatitis_c	
	No	Yes
Commercial Parlor	35	17
Elsewhere	53	8
No Tattoo	491	22
Total	579	47

Assumptions and Conditions

Step-By-Step Example: A Chi-Square Test for Independence

We use the `mosaic::tally()` function to prepare the data for the graphical display.

```
tally(has_hepatitis_c ~ location, format = "percent", data = Tattoos) |>
  data.frame() |>
  filter(has_hepatitis_c == "Yes") |>
  gf_col(Freq ~ location) |>
  gf_labs(x = "Tattoo Status", y = "Proportion Infected", title = "Tattoos and Hepatitis C")
```

```
# Observed
tally(location ~ has_hepatitis_c, data = Tattoos, margins = TRUE)
```

	has_hepatitis_c	
location	No	Yes
Commercial Parlor	35	17
Elsewhere	53	8
No Tattoo	491	22
Total	579	47

```
# Expected
with(chisq.test(tally(location ~ has_hepatitis_c, data = Tattoos, margins = TRUE)), expected,
```

Warning in chisq.test(tally(location ~ has_hepatitis_c, data = Tattoos, :
Chi-squared approximation may be incorrect

	has_hepatitis_c	
location	No	Yes
Commercial Parlor	48.09585	3.904153
Elsewhere	56.42013	4.579872
No Tattoo	474.48403	38.515974
Total	579.00000	47.000000

We note the warning that several of the expected cell counts are less than 5, which raises concerns about the accuracy of the test.

```
# Mechanics
with(chisq.test(tally(location ~ has_hepatitis_c, data = Tattoos)), statistic)
```

Warning in chisq.test(tally(location ~ has_hepatitis_c, data = Tattoos)):
Chi-squared approximation may be incorrect

X-squared
57.91217

```
xpchisq(q = 57.9, df = 2, lower.tail = FALSE)
```

```
[1] 2.674082e-13
```

Examine the Residuals

```
# Table 19.6, page 627
with(chisq.test(tally(location ~ has_hepatitis_c, data = Tattoos)), residuals)
```

```
Warning in chisq.test(tally(location ~ has_hepatitis_c, data = Tattoos)):
Chi-squared approximation may be incorrect
```

	has_hepatitis_c	
location	No	Yes
Commercial Parlor	-1.8883383	6.6278115
Elsewhere	-0.4553290	1.5981431
No Tattoo	0.7582168	-2.6612383

```
# Table 19.7, page 628
Tattoos <- Tattoos |>
  mutate(tattoo = ifelse(location == "No Tattoo", "None", "Tattoo"))
tally(tattoo ~ has_hepatitis_c, margins = TRUE, data = Tattoos)
```

tattoo	has_hepatitis_c	
	No	Yes
None	491	22
Tattoo	88	25
Total	579	47

Chi-Square and Causation
