

# IS5 in R: Sample Surveys (Chapter 10)

Nicholas Horton (nhorton@amherst.edu)

December 13, 2020

## Introduction and background

This document is intended to help describe how to undertake analyses introduced as examples in the Fifth Edition of *Intro Stats* (2018) by De Veaux, Velleman, and Bock. This file as well as the associated R Markdown reproducible analysis source file used to create it can be found at <http://nhorton.people.amherst.edu/is5>.

This work leverages initiatives undertaken by Project MOSAIC (<http://www.mosaic-web.org>), an NSF-funded effort to improve the teaching of statistics, calculus, science and computing in the undergraduate curriculum. In particular, we utilize the `mosaic` package, which was written to simplify the use of R for introductory statistics courses. A short summary of the R needed to teach introductory statistics can be found in the mosaic package vignettes (<https://cran.r-project.org/web/packages/mosaic>). A paper describing the mosaic approach was published in the *R Journal*: <https://journal.r-project.org/archive/2017/RJ-2017-024>.

## Chapter 10: Sample Surveys

```
library(mosaic)
library(readr)
library(janitor)
```

### Section 10.1: The Three Big Ideas of Sampling

### Section 10.2: Populations and Parameters

### Section 10.3: Simple Random Samples

```
Births <- read_csv("http://nhorton.people.amherst.edu/is5/data/AllBirths1998.csv")
```

### Random Matters

```
## Warning: Missing column names filled in: 'X1' [1]
##
## -- Column specification -----
## cols(
##   X1 = col_double(),
##   birthweight = col_double()
## )
```

By default, `read_csv()` prints the variable names. These messages can be suppressed using the `message=FALSE` code chunk option to save space and improve readability.

```
# Histogram of known population
gf_histogram(~birthweight, data = Births, binwidth = 125, center = 62.5) %>%
  gf_labs(x = "Weight (g)", y = "Births")
```

```
## Warning: Removed 4640 rows containing non-finite values (stat_bin).
```

The histogram shows the distribution of the population of nearly four million births.

Figure 10.2 (page 326):

```
# Samples of 100
set.seed(12452)
gf_density(~birthweight, data = sample(Births, size = 100), fill = 5) %>%
  gf_density(~birthweight, data = sample(Births, size = 100), fill = 4) %>%
  gf_labs(x = "Birthweights", y = "", title = "Two Samples of Size 100")
```

Two Samples of Size 100

```
# Samples of 250
set.seed(12452)
gf_density(~birthweight, data = sample(Births, size = 250), fill = 5) %>%
  gf_density(~birthweight, data = sample(Births, size = 250), fill = 4) %>%
  gf_labs(x = "Birthweights", y = "", title = "Two Samples of Size 250")
```

Two Samples of Size 250

```
# Samples of 1000
set.seed(12452)
gf_density(~birthweight, data = sample(Births, size = 1000), fill = 5) %>%
  gf_density(~birthweight, data = sample(Births, size = 1000), fill = 4) %>%
  gf_labs(x = "Birthweights", y = "", title = "Two Samples of Size 1000")
```

Two Samples of Size 1000
