# IS5 in R: Understanding and Comparing Distributions (Chapter 4)

Margaret Chien and Nicholas Horton (nhorton@amherst.edu)

July 11, 2018

# Introduction and background

This document is intended to help describe how to undertake analyses introduced as examples in the Fifth Edition of *Intro Stats* (2018) by De Veaux, Velleman, and Bock. More information about the book can be found at http://wps.aw.com/aw\_deveaux\_stats\_series. This file as well as the associated R Markdown reproducible analysis source file used to create it can be found at http://nhorton.people.amherst.edu/is5.

This work leverages initiatives undertaken by Project MOSAIC (http://www.mosaic-web.org), an NSF-funded effort to improve the teaching of statistics, calculus, science and computing in the undergraduate curriculum. In particular, we utilize the mosaic package, which was written to simplify the use of R for introductory statistics courses. A short summary of the R needed to teach introductory statistics can be found in the mosaic package vignettes (http://cran.r-project.org/web/packages/mosaic). A paper describing the mosaic approach was published in the R Journal: https://journal.r-project.org/archive/2017/RJ-2017-024.

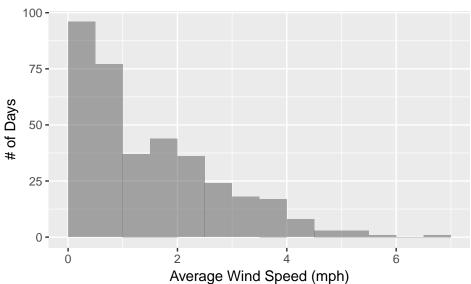

## Chapter 4: Understanding and Comparing Distributions

```
library(mosaic)
library(readr)
library(janitor)
HopkinsForest <- read_csv("http://nhorton.people.amherst.edu/is5/data/Hopkins_Forest.csv") %>%
  clean names()
## Parsed with column specification:
## cols(
##
     .default = col_double(),
##
     Date = col_character(),
##
     Year = col_integer(),
##
     Month = col_integer(),
##
     Day = col_integer(),
##
     `Day of Year` = col_integer(),
##
     `Max Sol Rad (w/m^2)` = col_integer(),
     `Min Sol Rad (w/m^2)` = col_integer(),
##
     `Total Sol Rad (w/m^2)` = col_integer(),
##
##
     `Min Wind (mph)` = col_integer(),
     `Max Barom (mb)` = col_integer(),
##
     `Min Barom (mb)` = col_integer()
##
## See spec(...) for full column specifications.
names (HopkinsForest)
    [1] "date"
                               "year"
                                                      "month"
    [4] "day"
                               "day_of_year"
                                                      "avg_temp_c"
   [7] "max_temp_c"
                               "min_temp_c"
##
                                                      "avg_temp_f"
```

```
## [10] "max_temp_f"
                               "min temp f"
                                                      "avg_rel_hum_percent"

                               "deep well ft"
                                                     "shallow well ft"
## [28] "x80 cm soil c"
                               "x10 cm soil c"
```

By default, read\_csv() prints the variable names. These messages can be suppressed using the message = FALSE code chunk option to save space and improve readability.

Here we use the clean\_names() function from the janitor package to sanitize the names of the columns (which would otherwise contain special characters or whitespace). You can use the names() function to check the cleaned names.

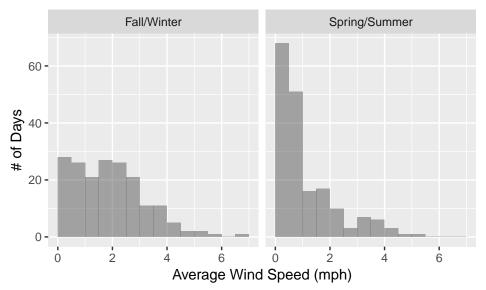

```
favstats(~ avg_wind_mph, data = HopkinsForest)

## min Q1 median Q3 max mean sd n missing
## 0 0.46 1.12 2.28 6.73 1.507808 1.260161 365 0
```

#### Section 4.1: Displays for Comparing Groups

#### Histograms

```
favstats(~ avg_wind_mph | catmonth, data = HopkinsForest)

## catmonth min Q1 median Q3 max mean sd n missing
## 1 Fall/Winter 0.02 0.84 1.72 2.6575 6.73 1.904176 1.287233 182 0
## 2 Spring/Summer 0.00 0.35 0.71 1.6150 5.47 1.113607 1.102176 183 0
```

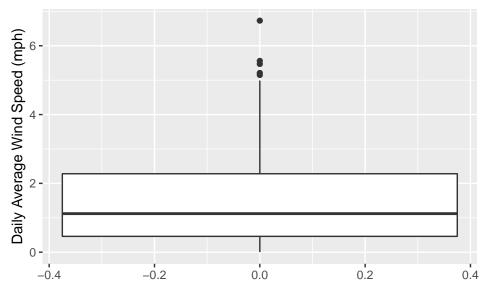

## Example 4.1: Comparing Groups with Stem-And-Leaf

```
# Figure 4.1, page 97
NestEgg <- read_csv("http://nhorton.people.amherst.edu/is5/data/Nest_Egg_Index.csv") %>%
  clean_names()
## Parsed with column specification:
## cols(
##
     State = col_character(),
     Nest.Egg.Index = col_double(),
##
     Region = col character()
##
## )
with(NestEgg, stem(nest_egg_index))
##
##
     The decimal point is 1 digit(s) to the right of the |
##
##
      8 | 57789
##
      9 | 0123344
      9 | 667777888899
##
##
     10 | 0012233333344
##
     10 | 5566779
##
     11 | 122444
```

## Boxplots

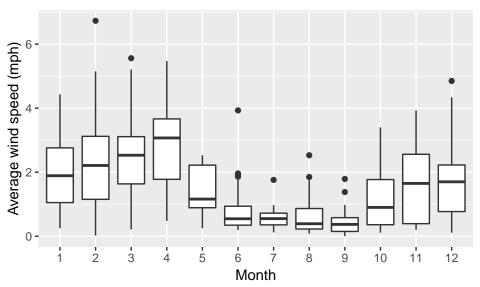

As noted in the book, boxplots are most useful to compare distributions. Below, we have replicated the single boxplot from page 98, but we don't recommend the use of single boxplots.

```
# Step 4 on page 98
gf_boxplot(~ avg_wind_mph, data = HopkinsForest, y = "Daily Average Wind Speed (mph)") # or gf_boxplot
```

Instead, we can make comparisons more easily by placing boxplots side by side with the following code:

```
# Figure 4.3, page 99
gf_boxplot(avg_wind_mph ~ as.factor(month), data = HopkinsForest) %>%
gf_labs(x = "Month", y = "Average wind speed (mph)")
```

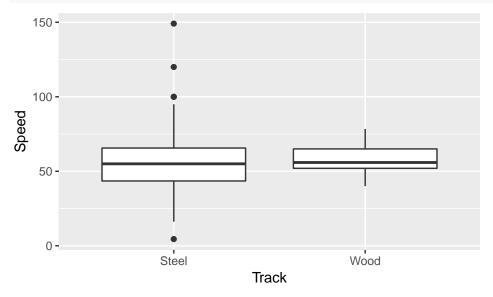

We use the as.factor() function to convert a variable into a factor.

## Example 4.2: Comparing Groups with Boxplots

```
# Example 4.2, page 99
Coasters <- read_csv("http://nhorton.people.amherst.edu/is5/data/Coasters_2015.csv")
## Parsed with column specification:
## cols(
## Name = col_character(),</pre>
```

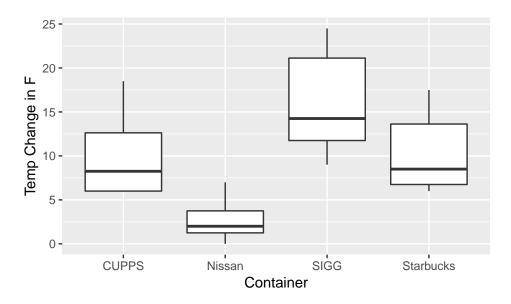

```
Park = col_character(),
##
##
     Track = col_character(),
     Speed = col_double(),
##
##
     Height = col_double(),
##
     Drop = col_double(),
##
     Length = col_double(),
##
     Duration = col integer(),
     Inversions = col_integer()
##
## )
```

### gf\_boxplot(Speed ~ Track, data = Coasters)

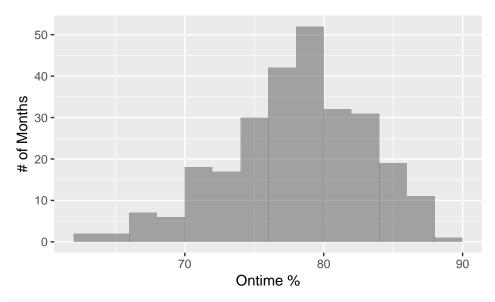

### Step-By-Step Example: Comparing Groups

```
Cups <- read_csv("http://nhorton.people.amherst.edu/is5/data/Cups.csv")</pre>
## Parsed with column specification:
## cols(
    Difference = col_double(),
##
##
     Container = col_character()
## )
favstats(~ Difference | Container, data = Cups)
     Container min
                      Q1 median
                                    Q3 max
                                               mean
## 1
         CUPPS
                 6 6.00
                           8.25 12.625 18.5 10.1875 5.202592 8
## 2
        Nissan
                 0 1.25
                           2.00 3.750 7.0 2.7500 2.507133 8
                                                                      0
## 3
          SIGG
                 9 11.75 14.25 21.125 24.5 16.0625 5.900590 8
                                                                      0
                           8.50 13.625 17.5 10.2500 4.551295 8
## 4 Starbucks
                 6 6.75
# Step by Step, page 101
gf_boxplot(Difference ~ Container, data = Cups, ylab = "Temp Change in F")
```

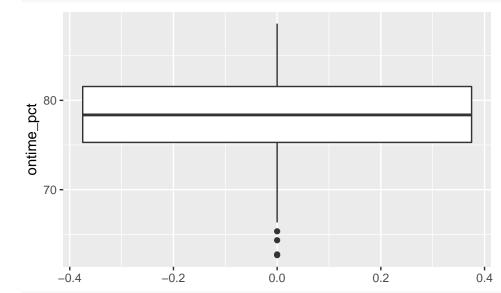

#### **Just Checking**

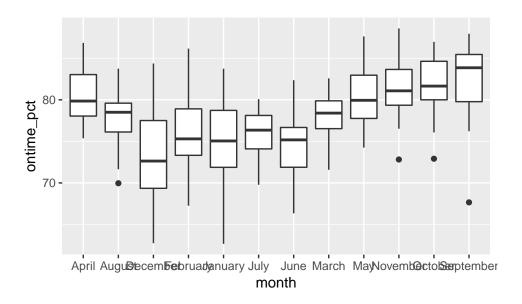

```
Flights <- read_csv("http://nhorton.people.amherst.edu/is5/data/Flights_on_time_2016.csv") %>%
  clean_names()
## Parsed with column specification:
##
     Year = col_double(),
##
     Month = col_character(),
     Onetime.Arrivals = col_integer(),
##
##
     Ontime.pct = col_double(),
     Arrival.Delays = col_integer(),
##
##
     Delayed.pct = col_double(),
##
     Flights.Cancelled = col_integer(),
##
     Cancelled.Pct = col_double(),
     Diverted = col_integer(),
##
##
     Flight.Operations = col_integer()
## )
# Bureau of Transportation Statistics, page 101
gf_histogram(~ ontime_pct, data = Flights, binwidth = 2, ylab = "# of Months", xlab = "Ontime %",
             center = 1)
```

gf\_boxplot(~ ontime\_pct, data = Flights)

gf\_boxplot(ontime\_pct ~ month, data = Flights)

#### **Random Matters**

```
# Figure 4.4, page 102
CarSpeeds <- read_csv("http://nhorton.people.amherst.edu/is5/data/Car_speeds.csv")</pre>
## Parsed with column specification:
## cols(
##
     direction = col_character(),
##
     speed = col_double()
## )
gf_boxplot(speed ~ direction, data = CarSpeeds)
   35 -
   30 -
  25 -
peeds 20 -
   15-
   10-
                                                     Úр
                     Down
                                   direction
```

XX MC removed beause we made the same graph earlier

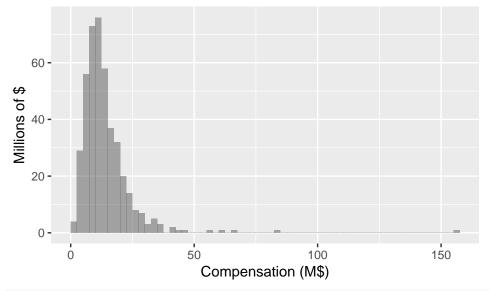

Section 4.3: Re-Expressing Data: A First Look

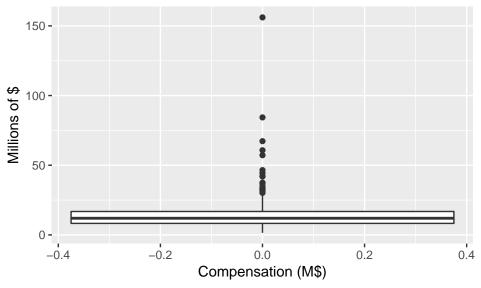

Re-Expressing to Improve Symmetry

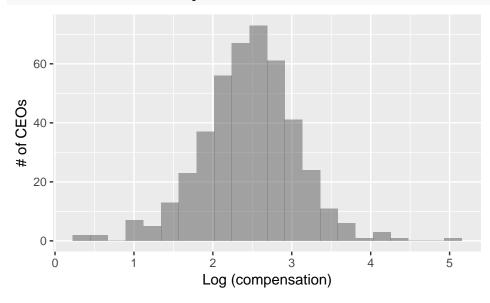

```
CEOComp <- read_csv("http://nhorton.people.amherst.edu/is5/data/CEO_Compensation_2014.csv") %>%
    clean_names()

## Parsed with column specification:
## cols(
```

```
## cols(
## Employer = col_character(),
## CEO = col_character(),
## CEO_Compensation = col_integer(),
## Median_Worker_Comp = col_integer(),
## Ratio = col_integer(),
## Company_Rating = col_double(),
## `CEO_Compensation_($M)` = col_double()
## )
```

## Re-Expression to Equalize Spread Across Groups
