# IS5 in R: Testing Hypotheses (Chapter 15)

Margaret Chien and Nicholas Horton (nhorton@amherst.edu)

July 13, 2018

# Introduction and background

This document is intended to help describe how to undertake analyses introduced as examples in the Fifth Edition of *Intro Stats* (2018) by De Veaux, Velleman, and Bock. More information about the book can be found at http://wps.aw.com/aw\_deveaux\_stats\_series. This file as well as the associated R Markdown reproducible analysis source file used to create it can be found at http://nhorton.people.amherst.edu/is5.

This work leverages initiatives undertaken by Project MOSAIC (http://www.mosaic-web.org), an NSF-funded effort to improve the teaching of statistics, calculus, science and computing in the undergraduate curriculum. In particular, we utilize the mosaic package, which was written to simplify the use of R for introductory statistics courses. A short summary of the R needed to teach introductory statistics can be found in the mosaic package vignettes (http://cran.r-project.org/web/packages/mosaic). A paper describing the mosaic approach was published in the R Journal: https://journal.r-project.org/archive/2017/RJ-2017-024.

# Chapter 15: Testing Hypotheses

```
library(mosaic)
library(readr)
library(janitor)
```

Section 15.1: Hypotheses

Section 15.2: P-Values

Section 15.3: The Reasoning of Hypothesis Testing

### Example 15.5: Finding A P-Value

```
n <- 90
x <- 61
p <- .8
phat <- x/n
sdphat <- ((p * (1 - p))/n)^.5
z <- (phat - p)/sdphat
pnorm(z)</pre>
```

```
## [1] 0.00187324
```

```
# Or, without calculating the z-score:
pnorm(q = phat, mean = p, sd = sdphat)
```

## [1] 0.00187324

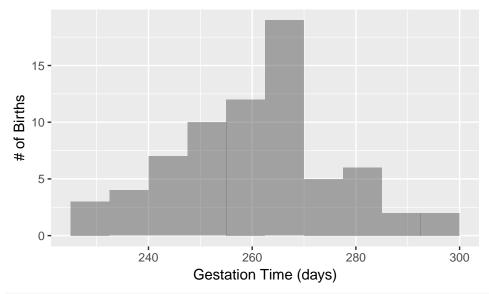

#### Section 15.4: A Hypothesis Test for the Mean

```
GestationTime <- read_csv("http://nhorton.people.amherst.edu/is5/data/Nashville.csv")</pre>
```

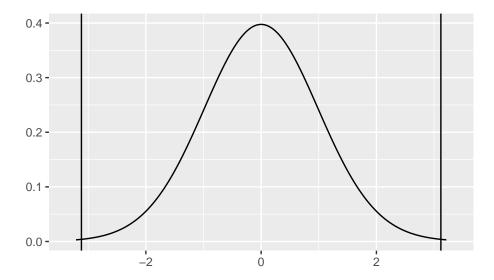

```
## Parsed with column specification:
## cols(
## Gestation = col_integer(),
## Time = col_character()
## )
```

By default, read\_csv() prints the variable names. These messages can be suppressed using the message=FALSE code chunk option to save space and improve readability.

```
# 2. Model (page 482)
gf_histogram(~ Gestation, data = GestationTime, binwidth = 7.5, center = 3.75) %>%
gf_labs(x = "Gestation Time (days)", y = "# of Births")
```

```
# 3. Mechanics
gf_dist(dist = "t", df = 69) %>%
    gf_vline(xintercept = -3.118) %>%
    gf_vline(xintercept = 3.118) %>%
    gf_labs(x = "", y = "") +
    xlim(-3.347, 3.347)
```

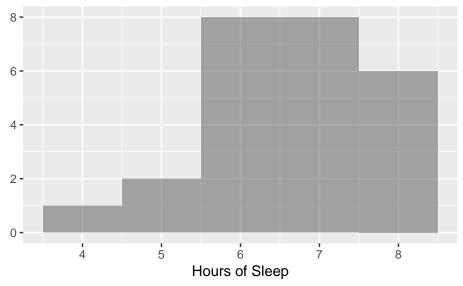

# Step-By-Step Example: A One-Sample t-Test for the Mean

```
Sleep <- read_csv("http://nhorton.people.amherst.edu/is5/data/Sleep.csv")</pre>
```

```
## Parsed with column specification:
## cols(
## Sleep = col_integer()
## )

# Plan
gf_histogram(~ Sleep, data = Sleep, binwidth = 1) %>%
    gf_labs(x = "Hours of Sleep", y = "")
```

```
gf_dist(dist = "t", df = 24) %>%
  gf_vline(xintercept = -1.67) %>%
  gf_labs(x = "", y = "") +
  xlim(-3, 3)
```

## Warning: Removed 674 rows containing missing values (geom\_path).

```
# Mechanics
n <- 25
mean <- 7.0
df <- 24
y <- 6.64
s <- 1.075
sey <- s/(n^.5)
t <- (y - mean)/sey # t-statistic
pt(q = t, df = df) # p-value</pre>
```

## [1] 0.05351625

# Section 15.5: Intervals and Tests

```
7.5 - 2.5 - 0.0 - 98 99 100 Temp
```

```
# Confidence interval
y <- mean(~ Temp, data = Temperatures)</pre>
У
## [1] 98.28462
s <- sd(~ Temp, data = Temperatures)</pre>
## [1] 0.6823789
n <- nrow(Temperatures)</pre>
## [1] 52
tstats \leftarrow qt(df = n - 1, p = c(.005, .995))
tstats
## [1] -2.675722 2.675722
y + (tstats * (s/(n^{.5})))
## [1] 98.03141 98.53782
# Hypothesis test
mu <- 98.6
t <- (y - mu)/(s/(n^{.5}))
## [1] -3.332856
2 * pt(q = t, df = n - 1) # two sided test
## [1] 0.001605849
```

#### Step-By-Step Example: Tests and Intervals

```
# Creating the data set
Baseball <- rbind(
  do(1308) * (winner = "HOME"),</pre>
```

```
do(2431 - 1308) * (winner = "AWAY")
) %>%
  rename(winner = result)
# Mechanics (page 490)
n <- nrow(Baseball)</pre>
p < -.5
phat <- Baseball %>%
  filter(winner == "HOME") %>%
  nrow()/n
phat
## [1] 0.5380502
sdphat <- ((p * (1 - p))/n)^.5
sdphat
## [1] 0.01014092
z <- (phat - p)/sdphat # z-value
## [1] 3.752142
1 - pnorm(z) \# p-value
## [1] 8.76651e-05
# Or, without calculating the z-score:
1 - pnorm(q = phat, mean = p, sd = sdphat)
## [1] 8.76651e-05
# Mechanics (page 491)
sep <- ((phat * (1 - phat))/n)^.5
sep
## [1] 0.01011152
me <- 1.96 * sep
phat - me # lower bound of 95% confidence
## [1] 0.5182316
phat + me # upper bound of 95% confidence
## [1] 0.5578688
```

Section 15.6: P-Values and Decisions: What to Tell About a Hypothesis Test
