IS5 in R: Relationships Between Categorical Variables—Contingency Tables (Chapter 3)

Margaret Chien and Nicholas Horton (nhorton@amherst.edu)

June 29, 2018

Introduction and background

This document is intended to help describe how to undertake analyses introduced as examples in the Fifth Edition of *Intro Stats* (2018) by De Veaux, Velleman, and Bock. More information about the book can be found at http://wps.aw.com/aw_deveaux_stats_series. This file as well as the associated R Markdown reproducible analysis source file used to create it can be found at http://nhorton.people.amherst.edu/is5.

This work leverages initiatives undertaken by Project MOSAIC (http://www.mosaic-web.org), an NSF-funded effort to improve the teaching of statistics, calculus, science and computing in the undergraduate curriculum. In particular, we utilize the mosaic package, which was written to simplify the use of R for introductory statistics courses. A short summary of the R needed to teach introductory statistics can be found in the mosaic package vignettes (http://cran.r-project.org/web/packages/mosaic). A paper describing the mosaic approach was published in the R Journal: https://journal.r-project.org/archive/2017/RJ-2017-024.

Chapter 3: Relationships Between Categorical Variables—Contingency Tables

Section 3.1: Contingency Tables

cats_dogs_both

Has Both

##

```
library(mosaic)
library(readr)
library(janitor)
OKCupid <- read_csv("http://nhorton.people.amherst.edu/is5/data/OKCupid_CatsDogs.csv", skip = 1) %>%
  clean_names()
## Parsed with column specification:
## cols(
##
     CatsDogsBoth = col_character(),
##
     Gender = col_character(),
     `drugsY/N` = col_character(),
     `smokesY/N` = col_character()
##
## )
names (OKCupid)
## [1] "cats dogs both" "gender"
                                           "drugs_y_n"
                                                             "smokes y n"
By default, read_csv() prints the variable names.
                                                  These messages can be suppressed using the
message=FALSE code chunk option to save space and improve readability.
Here we use the clean_names() function from the janitor package to sanitize the names of the columns
```

(which would otherwise contain special characters or whitespace).

```

Example 3.7: Looking for Associations Among Three Variables at Once

```
vcd::mosaic(tally(~ Sex + Survived + Class, data = Titanic), shade = TRUE)
```

Example 3.8: Simpson's Paradox: Gender Discrimination?

Here we demonstrate how to generate one of the tables on page 80.

```
# Create a dataframe from the counts
{\it \# http://mathemathinking.blogspot.com/2012/06/simpsons-paradox.html}
Berk <- rbind(</pre>
                  data.frame(admit = TRUE, sex = "M", school = "A"),
  do(512) *
  do(825 - 512) * data.frame(admit = FALSE, sex = "M", school = "A"),
                  data.frame(admit = TRUE, sex = "F", school = "A"),
 do(89) *
                  data.frame(admit = FALSE, sex = "F", school = "A")
 do(19) *
)
class(Berk)
## [1] "do.data.frame" "data.frame"
tally(~ sex + admit, data = Berk)
##
      admit
## sex TRUE FALSE
##
    Μ
       512
              313
     F
         89
##
               19
tally(~ admit | sex, format = "percent", data = Berk)
##
          sex
## admit
                  Μ
##
     TRUE 62.06061 82.40741
     FALSE 37.93939 17.59259
```

In this case, do(n) creates n number of observations with the properties in data.frame(). We use data.frame() to make Berk a data frame. This can be checked with the class() function. rbind() is used to combine the data frames into one.
